Impact of Cardiac Surgery on the Quality of Life May 30 2021 Georg Rodewald University of Hamburg Hamburg, Federal Republic of Germany Allen E. Willner Hillside Hospital Glen Oaks, NY In contrast to the initial years of cardiac surgery (37 years ago), there is now increasing interest in cerebral protection. Rodewald [1] in 1978 was among the first to point out the surgeon's concern with "psychopathological problems" and Taylor [2] in 1989 stressed that" ••• the awareness of the cerebral consequences of open heart surgery has risen considerably in recent years • • • " This book reviews the evidence for neurological, psychological, and neuropsychological reactions to cardiac surgery. In previous studies one problem is that small samples of patients were studied with different measuring instruments so that it was difficult to make sense of inconsistent findings. Considerable controversy resulted with little ability to sort out discrepant findings. It appeared that a large multi center study using uniform measures might help clarify the picture.

Progress in Stapes Mobilization Surgery Oct 03 2021 Otosclerosis is the most common cause of progressive hearing loss of a conductive type in adults. Stapes mobilization effected by the direct method was revived in 1953. Recent procedures involve fenestration of the footplate, the use of a vein graft, and reconstruction of the stapes with tantalum or stainless steel wire or a polyethylene prosthesis. Fenestration of the horizontal semicircular canal is ordinarily considered permanently disqualifying for flying duties and a waiver can be granted only by the Surgeon General, U.S. Air Force. An Air Force policy has not been formulated with regard to fenestration of the footplate of the stapes. Aviation medicine principles should be considered in the choice of a surgical procedure for otosclerosis performed on an aircrew member. Mobilization of the stapes achieved conservatively by manipulation of the head of the stapes or occasionally by chisels is recommended and has been demonstrated not to have adversely affected the performance of flying duties by aircrewmembers. Until it has been definitely determined that the middle ear can tolerate fenestration or removal of the footplate, addition of grafts and prostheses, without compromising the integrity of the inner ear while being subjected to the inevitable, repeated bouts of severe atmospheric pressure changes encountered in military aircraft, it would seem wise to refrain from using these procedures on flying personnel. (Author).
